J.A: I think it's better to get a support from adobe people. If you are in Russia, you can talk to an official team here: Or maybe someone can help you over Telegram? A second peak in late autumn or early winter is possible in the current season, but odds of a spring peak are low, say experts. The chance of a weak winter storm is even lower. Experts have an even lower chance of a Halloween-like event this year with cold temperatures and heavy snow. The initial forecasts for the next two months include less than a third of the snowfalls that occurred in the past two winters. Although it could snow this winter, and even more than normal, it is unlikely to do so in the beginning of the year or even right at the end. "In terms of the amount of snow, in the beginning of the year, right at the end of the year, we should have pretty average, but not more," said Northwestern University meteorologist Ron Kato. The National Weather Service will update its forecasts on Saturday and Sunday. More than one-third of all U.S. land areas will receive more snow than last winter, when nearly 20 inches fell on parts of the Northeast. About two-thirds of the country will receive more snow in the second half of the winter than the first. Don't Edit Looking at the winter storm outlook for the United States. In terms of snow, Minnesota could receive about double the snowfall it received last year and western Minnesota could have more snow than was expected in 2016. About half of the country will receive more snow in the winter than the past three years, while the other half could get less snow than average. NWS A few towns like Big Bear, Utah and other small communities in the mountains of Wyoming could have a winter like 2014 with up to 70 inches of snow. This could be possible but it would be very unlikely, especially if there are 82157476af
